Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/766,246

Applicant(s)

NIELSEN ET AL.

Examiner

HIEU T. HOANG

Art Unit

2452

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06 February 2009.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-37 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-37 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SG/US)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. This office action is in response to the amendment filed on 02/06/2009.
2. Claims 1-37 are pending.

Response to Arguments

3. Applicant's arguments have been fully considered but found unpersuasive.
4. **35 USC 112**, first paragraph rejection of claim 5. The rejection is maintained as the claim fails to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The claim discloses "the first remote system to generate a response and the first remote system to have its response received by the client". The examiner cannot find any disclosure in the specification regarding "the first remote system to generate a response" in the specification. Clearly a first remote system to generate a response can be different from a first remote system to have its response received by the client, implied in the claimed language and as known in the art due to inherent network delays of transferring the response to the client. There is no assigning task based on a first remote system to generate a response in the original disclosure.
5. **35 USC 103 rejection**

For claim 1, applicant argues that Cajolet-Banz-ON does not teach assigning a task to a first server to respond. The examiner respectfully disagrees. Cajolet teaches

that remote systems send response messages to a task indication message (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done). Banz teaches queuing first in first out a plurality of workstations in a queue so that task can be assigned to the first workstation in the queue ([0021] lines 1-7, select a first available call taker workstation, in a queue as known in the art, to assign the next call to). It would have been obvious for one skilled in the art to combine the teachings of Cajolet and Banz to assign task to a first available remote system so that the system corresponding to first response message (or the first available system) is to be assigned the task first. The combination does not teach away from the claimed invention since there is no disclosure, teachings and/or suggestions in Cajolet that would enable one of ordinary skilled in the art to conclude that Cajolet avoids assigning task to the first system to respond. See *In re Fulton*, 391 F.3d 1195, 1201, 73 USPQ2d 1141, 1146 (Fed. Cir. 2004) [However, "the prior art's mere disclosure of more than one alternative does not constitute a teaching away from any of these alternatives because such disclosure does not criticize, discredit, or otherwise discourage the solution claimed...."]. The citation of Official Notice is to notice the fact that first-in first-out queuing is extremely known in the art of networking. One skilled in the art can appreciate from the teachings of Cajolet-Banz that implementing a FIFO queue so that first received response message will be processed with task assignment is a simple application of using a FIFO queue.

6. For claim 2, applicant argues that the prior art does not teach a router to distribute a task to a plurality of remote systems according to a distribution list. The

examiner disagrees. Harper discloses a gateway in between a task dispatcher and remote systems, capable of transferring information between the task dispatcher and the remote systems (fig. 2, a gateway connected to a dispatcher for transmitting information, gateway and dispatcher can be one entity). Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet-Banz-ON and Harper to dispatch tasks to multiple servers or assistant computers via a gateway or a router to implement a larger or a WAN distributed system or to provide more scalability and failover capability.

7. For claim 32, applicant argues that the prior art does not teach reserving takes places at the remote system. How can a remote computer in Cajolet provide task processing if required resources for the task are not reserved at the remote computer? It is obvious that the remote computer must reserve its task processing resources in order to be able to process the task when it is assigned to the remote system. The examiner further cites Jones to indicate that resource reservation is known in the art. Furthermore, reciting reserving takes places at the remote system does not mean that the remote system itself initiates the reservation; it simply means that the resources at the remote system is reserved. The argument is therefore moot.

Claim Rejections - 35 USC § 112

8. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

9. Claim 5 is rejected under 35 U.S.C. 112, first paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention, and as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The claim discloses "the first remote system to generate a response and the first remote system to have its response received". The examiner cannot find any disclosure in the specification regarding "the first remote system to generate a response" in the specification. Clearly a first remote system to generate a response can be different from a first remote system to have its response received by the client, implied in the claimed language and as known in the art due to inherent network delays of transferring the response to the client. There is no assigning task based on a first remote system to generate a response in the original disclosure.

Claim Rejections - 35 USC § 103

10. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

11. Claims 1, 3-7, 9-15, 17-19, 28, 29 and 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cajolet (US 6,192,388), in view of Bantz et al. (US

2002/0169606, hereafter Bantz), further in view of what has been known in the art (Official Notice or ON)

12. For claim 1, Cajolet discloses a method, comprising:

indicating to one or more remote systems in a distributed data processing system that a task, in a task list, is available for processing based on a distribution list (fig. 6 step 100, assisting computers receive request for assistance on task processing, col. 9 lines 63-64, fig. 7 item 136, list of assistant computers, col. 3 lines 17-21, task portion queue or list); wherein an indication specifies at least one resource requirement (col. 8 lines 24-36, a job servicing request has indication of software required to do the job)

receiving at least one response from the one or more remote systems capable of performing the task responsive to receiving the indication (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done);

wherein the at least one response is based on a determination by the one or more remote systems that the at least one resource requirement is satisfied (col. 8 lines 24-36, checking whether the computer that received the request can satisfy the request's requirement such as software needed)

assigning the task from the task list to a remote system of the one or more remote systems to respond based on a selection (fig. 6 steps 110-112, col. 2 line 63-col. 3 line 11, assigning task to assisting computers participate in distributed task processing, col. 8 lines 43-53, dispatcher receiving responses from assisting computers and selecting one to assign the task to)

Cajolet does not explicitly disclose the selection is selecting a first remote system from a queue of the one or more remote systems.

However, Bantz discloses the same ([0021] lines 1-7, select a first available call taker workstation, in a queue as known in the art, to assign the next call to)

It would have been obvious for one skilled in the art to combine the teachings of Cajolet and Bantz to assign task to a first available remote system so that the system corresponding to first response message (or the first available system) is to be assigned the task first.

Cajolet-Bantz does not disclose the task is a compilation task.

However, Official Notice is taken that distributing compilation tasks is known at the time of the invention (see e.g., Sundararajan et al., US 6,487,577, abstract).

Also Official Notice is taken that queuing techniques such as First In First Out (FIFO) is known in the art, meaning assigning tasks in a first in first out manner such that first arrival response will be assigned task to is well known.

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet, Bantz and what has been known in the art to assign compilation tasks to the first available workstation or assisting computer to implement a basic workload algorithm (Bantz, [0021]).

13. For claim 3, Cajolet-Bantz-ON further discloses indicating to the one or more remote systems comprises indicating a threshold criterion that the one or more remote systems should satisfy, and wherein receiving the at least one response comprises

receiving the at least one response from the one or more remote systems that satisfy the threshold criterion (Cajolet, fig. 8, col. 11 lines 11-60, thresholds that assistant processing computers have to pass in order to satisfy the requirement of the tasks).

14. For claim 4, Cajolet-Bantz-ON further discloses indicating the threshold criterion comprises indicating at least one of a preselected processing speed, memory size, and network speed for the one or more remote systems (Cajolet, fig. 8, col. 11 lines 11-60).

15. For claim 5, Cajolet-Bantz-ON further discloses receiving the at least one response comprises receiving configuration information associated with the one or more remote systems (Cajolet, col. 8 lines 38-40, sending configuration to task dispatcher); and wherein the first remote system to respond refers to at least one of a first remote system to generate a response and a first remote system to have its response received (Cajolet, col. 8 lines 43-52, responses received from remote systems at a problem dispatcher, Bantz, [0021], selection of the first available system to assign task to)

16. For claim 6, Cajolet-Bantz-ON further discloses receiving the configuration information comprises receiving information including at least one of a processing speed, memory size, network speed, and load level associated with the one or more remote systems (Cajolet, fig. 8, col. 11 lines 11-60).

17. For claim 7, Cajolet-Bantz-ON further discloses allowing at least one of the one or more remote systems to perform the task comprises allowing at least one of the one or more remote systems to perform the task based on a selection scheme (Cajolet, col. 8 lines 43-53, selection of assistant computers), wherein the selection scheme comprises at least one of allowing a remote system that responds first to perform the task (Bantz, select a first available call taker workstation to process the next call) and allowing a remote system to perform the compilation task based on the received configuration information (Cajolet, col. 8 lines 39-53, selection of assistant computer based on its configuration).

18. For claim 9, Cajolet-Bantz-ON further discloses the act of indicating comprises indicating that the compilation task is available for processing (Cajolet, fig. 6 steps 100-102, receive request for processing of an available task), and wherein the act of receiving comprises receiving the at least one response from a remote system that has reserved at least a portion of its resources for performing the task (Cajolet, fig. 8 available resources at the assistant computers).

19. For claim 10, Cajolet discloses an article comprising one or more machine-readable storage media containing instructions that when executed enable a processor to:

indicate to a plurality of remote systems in a distributed data processing system that a task in a task list is available for processing based on a list identifying the remote

systems (fig. 6 step 100, assisting computers receive request for assistance on task processing, col. 9 lines 63-64, list of assistant computers, col. 3 lines 17-21, task portion queue or list); wherein the indication specifies at least one resource requirement (col. 8 lines 24-36, a job servicing request has indication of software required to do the job)

assign the task from the task list to a remote system of the one or more remote systems to respond based on a selection (fig. 6 steps 110-112, col. 2 line 63-col. 3 line 11, assigning task to assisting computers participate in distributed task processing; col. 8 lines 43-53, dispatcher receiving responses from assisting computers and selecting one to assign the task to); wherein assigning is based on a determination by the one or more remote systems that the at least one resource requirement is satisfied (col. 8 lines 24-36, checking whether the computer that received the request can satisfy the request's requirement such as software needed)

Cajolet does not explicitly disclose the selection is selecting a first remote system from a queue of the one or more remote systems.

However, Bantz discloses the same ([0021] lines 1-7, select a first available call taker workstation, in a queue as known in the art, to assign the next call to)

Cajolet-Bantz does not disclose the task is a compilation task.

However, Official Notice is taken that distributing compilation tasks is known at the time of the invention (see e.g., Sundararajan et al., US 6,487,577, abstract). Also Official Notice is taken that queuing techniques such as First In First Out (FIFO) is known in the art.

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet, Bantz and what has been known in the art to assign compilation tasks to the first available workstation or assisting computer to implement a basic workload algorithm (Bantz, [0021]) by assigning task to a first available remote system so that the system corresponding to first response message (or the first available system) is to be assigned the task first.

20. For claim 11, Cajolet-Bantz-ON further discloses the task is a compilation task (Cajolet, col. 9 lines 6-9, a rendering task composing of many task portions) and wherein the instructions when executed enable the processor to allow at least one of the plurality of remote systems based on a selection scheme (Cajolet, col. 8 lines 43-53).

21. For claim 12, Cajolet-Bantz-ON further discloses the instructions when executed enable the processor to allow that remote system which responds first to perform the task (Bantz, [0021] lines 1-7, select a first available call taker workstation to process the next call).

22. For claim 13, Cajolet-Bantz-ON further discloses the instructions when executed enable the processor to allow the remote system having at least one of a higher processing speed among the plurality of responding remote systems to perform the task (Cajolet, fig. 7 steps 130, 132) and a desirable performance characteristic, wherein the

performance characteristic is determined based on past performance (Cajolet, col. 11 lines 20-60, past performance).

23. For claim 14, Cajolet-Bantz-ON further discloses the instructions when executed enable the processor to allow a plurality of remote systems to perform the task in response to determining that a number of responding remote systems exceed a number of available tasks (Cajolet, col. 9 lines 5-15, a plurality of assistant computers to process portions of a same task).

24. For claim 15, Cajolet-Bantz-ON further discloses the instructions when executed enable the processor to receive responses from at least one of the plurality of the remote systems, wherein the response includes configuration information associated with the one or more remote systems (Cajolet, col. 8 lines 38-42, responses with computer characteristics).

25. For claim 17, Cajolet-Bantz-ON further discloses the instructions when executed enable the processor to receive results from the at least one remote system that is allowed to perform the task (Cajolet, fig. 5, send render task and receive finished render task).

26. For claim 18, Cajolet discloses an apparatus, comprising:

means for indicating to one or more remote systems in a distributed data processing system that a task in a task list is available for processing based on a distribution list identifying the one or more remote systems (fig. 6 step 100, assisting computers receive request for assistance on task processing, col. 9 lines 63-64, list of assistant computers, col. 3 lines 17-21, task portion queue or list); and wherein the means for indicating specifies at least one resource requirement (col. 8 lines 24-36, a job servicing request has indication of software required to do the job)

means for receiving at least one response from the one or more remote systems capable of performing the task based on the indication (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done); wherein the at least one response is based on a determination by the one or more remote systems that the at least one resource requirement is satisfied (col. 8 lines 24-36, checking whether the computer that received the request can satisfy the request's requirement such as software needed); and

means for assigning the task from the task list to a remote system of the one or more remote systems to respond based on a selection (fig. 6 steps 110-112, col. 2 line 63-col. 3 line 11, assigning task to assisting computers participate in distributed task processing; col. 8 lines 43-53, dispatcher receiving responses from assisting computers and selecting one to assign the task to)

Cajolet does not explicitly disclose the selection is selecting a first remote system from a queue of the one or more remote systems.

However, Bantz discloses the same ([0021] lines 1-7, select a first available call taker workstation, in a queue as known in the art, to assign the next call to)

Cajolet-Bantz does not disclose a distributed data processing compilation system.

However, Official Notice is taken that distributing compilation tasks is known at the time of the invention (see e.g., Sundararajan et al., US 6,487,577, abstract). Also Official Notice is taken that queuing techniques such as First In First Out (FIFO) is known in the art.

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet, Bantz and what has been known in the art to assign compilation tasks to the first available workstation or assisting computer to implement a basic workload algorithm (Bantz, [0021]) by assigning task to a first available remote system so that the system corresponding to first response message (or the first available system) is to be assigned the task first.

27. For claim 19, Cajolet discloses an apparatus, comprising:

an interface adapted to communicate with one or more remote systems; and
a control unit communicatively coupled to the interface, the control unit adapted to:

indicate to the one or more remote systems in a distributed data processing system that a task in a task list is available for processing based on a distribution list identifying the one or more remote systems (fig. 6 step 100, assisting computers receive

request for assistance on task processing, col. 9 lines 63-64, list of assistant computers, col. 3 lines 17-21, task portion queue or list); and wherein the indication specifies at least one resource requirement (col. 8 lines 24-36, a job servicing request has indication of software required to do the job)

receive at least one response from the one or more remote systems capable of performing the task based on the indication (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done); wherein the at least one response is based on a determination by the one or more remote systems that the at least one resource requirement is satisfied (col. 8 lines 24-36, checking whether the computer that received the request can satisfy the request's requirement such as software needed); and

assign the task from the task list to a remote system of the one or more remote systems to respond based on a selection (fig. 6 steps 110-112, col. 2 line 63-col. 3 line 11, assigning task to assisting computers participate in distributed task processing; col. 8 lines 43-53, dispatcher receiving responses from assisting computers and selecting one to assign the task to)

Cajolet does not explicitly disclose the selection is selecting a first remote system from a queue of the one or more remote systems.

However, Bantz discloses the same ([0021] lines 1-7, select a first available call taker workstation, in a queue as known in the art, to assign the next call to)

Cajolet-Bantz does not disclose a distributed data processing compilation system.

However, Official Notice is taken that distributing compilation tasks is known at the time of the invention (see e.g., Sundararajan et al., US 6,487,577, abstract)

Also Official Notice is taken that queuing techniques such as First In First Out (FIFO) is known in the art.

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet, Bantz and what has been known in the art to assign compilation tasks to the first available workstation or assisting computer to implement a basic workload algorithm (Bantz, [0021]), by assigning task to a first available remote system so that the system corresponding to first response message (or the first available system) is to be assigned the task first.

28. For claim 28, Cajolet-Bantz-ON further discloses the control unit is adapted to identify the task that is available for processing in a queue that is accessible by one or more of the remote systems (Cajolet, fig. 7 steps 146-148, continuing to new task portion in a queue).

29. For claim 29, the claim is rejected for the same rationale as in claim 19.

30. For claim 31, Cajolet-Bantz-ON further discloses at least one of the one or more remote systems is adapted to: detect an indication from the client system that a compilation task is available for processing (Cajolet, fig. 6 step 100, assisting computers receive request for assistance on task processing); determine if the at least one remote

system is capable of processing the compilation task (Cajolet, fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done); and process the compilation task for the client system in response to determining that at least one remote system is capable of processing the compilation task (Cajolet, fig. 6 steps 110-112, assisting computers participate in distributed task processing).

31. Claims 35 and 37 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cajolet in view of Bantz.

32. For claim 35, Cajolet discloses a method, comprising:

indicating to one or more remote systems in a distributed data processing system that a task in a task list is available for processing (fig. 6 step 100, assisting computers receive request for assistance on task processing, col. 3 lines 17-21, task portion queue or list); and wherein the indication specifies at least one resource requirement (col. 8 lines 24-36, a job servicing request has indication of software required to do the job)

receiving at least one response from the one or more remote systems capable of performing the task responsive to receiving the indication (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done); wherein the at least one response is based on a determination by the one or more remote systems that the at least one resource requirement is satisfied (col. 8 lines 24-36, checking whether the computer that received the request can satisfy the request's requirement such as software needed); and

assigning the task from the task list to a remote system of the one or more remote systems to respond based on a selection (fig. 6 steps 110-112, col. 2 line 63-col. 3 line 11, assigning task to assisting computers participate in distributed task processing; col. 8 lines 43-53, dispatcher receiving responses from assisting computers and selecting one to assign the task to)

Cajolet does not explicitly disclose the selection is selecting a first remote system from a queue of the one or more remote systems.

However, Bantz discloses the same ([0021] lines 1-7, select a first available call taker workstation, in a queue as known in the art, to assign the next call to)

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet, Bantz to assign tasks to the first available workstation or assisting computer to implement a basic workload algorithm (Bantz, [0021]), by assigning task to a first available remote system so that the system corresponding to first response message (or the first available system) is to be assigned the task first.

33. For claim 37, Cajolet-Bantz further discloses the task is at least one of a compilation task, a video processing task, audio processing task, image processing task, encryption task, and decryption task (Cajolet, fig. 5, 3D image rendering task)

34. Claims 16, 30 and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cajolet-Bantz, in view of what has been known in the art, and in view of Hinni et al. (US 2007/0011226, hereafter Hinni)

35. For claim 36, Cajolet-Bantz further discloses the distributed system is a distributed system, and wherein indicating comprises indicating to the one or more remote systems that a task is available for processing (fig. 6 step 100, assisting computers receive request for assistance on task processing); wherein the indication was based on a distribution list identifying the one or more remote systems (fig. 7, 136, list of assistants), and further wherein receiving the at least one response comprises receiving the at least one response from the one or more remote systems capable of performing the task responsive to receiving the indication (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done)

Cajolet-Bantz does not disclose a distributed compilation system with compilation tasks.

However, Official Notice is taken that distributing compilation tasks is known at the time of the invention (see e.g., Sundararajan et al., US 6,487,577, abstract)

Cajolet-Bantz-ON further discloses the client transmitting task request to a plurality remote computers (Cajolet, fig. 7 steps 123, 126). Cajolet-Bantz-ON does not explicitly disclose the request from the client system was a multicast request.

However, Hinni discloses the same ([0079] lines 3-5, multicast task request to multiple task handlers)

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet-Bantz and ON and Hinni to multicast task request to a plurality of computers since multicasting is an efficient method of transmitting same information to multiple receivers (as compared to, e.g., unicasting).

36. Claims 16 and 30 are rejected for the same rationale as in claim 36.

37. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Cajolet-Bantz-ON as applied to claim 1 above, and further in view of Harper et al. (US 2002/0087612, hereafter Harper).

38. For claim 2, Cajolet-Bantz-ON further discloses the distribution list comprises destination addresses associated with the one or more remote systems (Cajolet, col. 9 lines 63-64, list of assistant computers, obviously containing their addresses), and transmitting transmits at least a portion of the message to a plurality of the remote systems based on the distribution list (Cajolet, col. 6 l. 41-47, transmitting requests to assist in processing tasks to multiple computers)

Cajolet-Bantz-ON does not explicitly disclose providing a message to a router that, responsive to the message, transmits at least a portion of the message to a plurality of the remote systems based on the distribution list.

However, Harper discloses a gateway in between a task dispatcher and remote systems, capable of transferring information between the task dispatcher and the

remote systems (fig. 2, a gateway connected to a dispatcher for transmitting information, gateway and dispatcher can be one entity)

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet-Bantz-ON and Harper to dispatch tasks to multiple servers or assistant computers via a gateway or a router to implement a larger or a WAN distributed system or to provide more scalability and failover capability.

39. Claims 8 and 20-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cajolet-Bantz-ON as applied to claim 1 above, and further in view of Harper and Hinni.

40. For claim 8, Cajolet-Bantz-ON does not explicitly disclose wherein indicating to the one or more remote systems comprises providing a message to a router that, responsive to the message, transmits, at least a portion of the message to a plurality of the remote systems based on the distribution list;

However, Harper discloses the same (fig. 2, a gateway connected to a dispatcher for transmitting task advertisements)

Cajolet-Bantz-ON-Harper does not disclose wherein the distribution list is a multicast list, and transmitting is via multicast.

However, Hinni discloses the same ([0079] lines 3-5, multicast task request to multiple task handlers)

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet-Bantz-ON, Harper and Hinni to multicast task request to a plurality of computers since multicasting is an efficient method of transmitting same information to multiple receivers (as compared to, e.g., unicasting).

41. Claim 20 is rejected for the same rationale as in claim 8.

42. For claim 21, Cajolet-Bantz-ON-Harper-Hinni further discloses the control unit is adapted to indicate a threshold criterion that the one or more remote systems should satisfy and further adapted to receive the at least one response from the one or more remote systems that satisfy the threshold criterion (Cajolet, fig. 8, col. 11 lines 11-60, thresholds that assistant processing computers have to pass in order to satisfy the requirement of the tasks).

43. For claim 22, Cajolet-Bantz-ON-Harper-Hinni further discloses the control unit is adapted to indicate at least one of a minimum processing speed, memory amount, and network speed for the one or more remote systems (Cajolet, fig. 8, col. 11 lines 11-60).

44. For claim 23, Cajolet-Bantz-ON-Harper-Hinni further discloses the control unit is adapted to receive configuration information associated with the one or more remote systems (Cajolet, col. 8 lines 38-40, sending configuration to task dispatcher).

45. For claim 24, Cajolet-Bantz-ON-Harper-Hinni further discloses the control unit is adapted to receive information including at least one of a processing speed, memory size, network speed, and load level associated with the one or more remote systems (Cajolet, fig. 8, col. 11 lines 11-60).

46. For claim 25, Cajolet-Bantz-ON-Harper-Hinni further discloses allowing at least one of the remote systems to perform the task comprises allowing the one or more remote systems to perform the task based on a selection scheme (Cajolet, col. 8 lines 43-53, selection of assistant computers).

47. For claim 26, Cajolet-Bantz-ON-Harper-Hinni further discloses the instructions when executed enable the processor to allow that remote system which responds first to perform the task (Bantz, [0021] lines 1-7, select a first available call taker workstation to process the next call).

48. For claim 27, Cajolet-Bantz-ON-Harper-Hinni further discloses the selection scheme comprises allowing a remote system to perform the compilation task based on the received configuration information (Cajolet, fig. 6 steps 110-112, assisting computers participate in distributed task processing).

49. Claims 32-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cajolet in view of Jones et al. (US 2002/0007389, hereafter Jones), further in view of what has been known in the art (ON).

50. For claim 32, Cajolet discloses a method, comprising:

detecting an indication from a client system to process one or more tasks (fig. 6 step 100, assisting computers receive request for assistance on task processing);

determining if a remote system that detects the indication is capable of processing at least one of the one or more tasks in response to detecting the indication from the client system (fig. 6 step 104-106, assisting computers send back response with computer characteristics that task can be done); and

processing the at least one task for the client system in response to at least one or more of the tasks from the client system being assigned to first remote system (fig. 6 steps 110-112, assisting computers participate in distributed task processing, assigning task to the best computer based on a formula).

Cajolet does not explicitly disclose reserving one or more resources of the remote system in response to determining that the remote system is capable of processing the at least one of the compilation task; wherein the reserving takes place at the remote system.

However, Jones discloses reserving a resource after determining amount of resource needed for a requested task (abstract, fig. 2, items 34-36), wherein resources

is reserved at the remote systems ([0012], local resource planner reserves resource of the distributed computer systems)

Cajolet-Jones does not disclose a distributed compilation system with compilation tasks.

However, Official Notice is taken that distributing compilation tasks is known at the time of the invention (see e.g., Sundararajan et al., US 6,487,577, abstract)

Therefore, it would have been obvious for one skilled in the art at the time of the invention to combine the teachings of Cajolet and Jones and what has been known to reserve resource in response to determining that the remote system is capable of processing the at least one of the compilation task in order to make the resource of an assisting computer available when needed and therefore make distributed program running on multiple machines exhibit predictable behavior (Jones, abstract).

51. For claim 33, Cajolet-Jones-ON further discloses providing results of the processing to the client system (Cajolet, fig. 5, send render task and receive finished render task).

52. For claim 34, Cajolet-Jones-ON further discloses the processing comprises accessing a queue associated with the client system and determining the compilation task to process (Cajolet, fig. 7 steps 146-148, continuing to new task portion in a queue).

Conclusion

53. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

54. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hieu T. Hoang whose telephone number is 571-270-1253. The examiner can normally be reached on Monday-Thursday, 8 a.m.-5 p.m., EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, John Follansbee can be reached on 571-272-3964. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
